symptoms tracking ↔ medication tracking

variable symptions = variable medications

types of medications

1. set medication on what you are on all the time- disease management

arthititis focused medications

immunosupp resents

on doc file - urgency around it - markers for limits - medication > x number is concerning

impact associated

2. SOS kind- steroids and painkillers for symptom management

seriods based medication

non -steriod anti inflaimmatory NSAID

allergic reactions

impact associated

3. Side Effects management, supplements

nausea, anti- deperessants - also fairly regular

supplements - to remove the amount of toxins in the blood stean

long term impact on your body of the current medication - **"steal the quote from Doctor's file"**

medication delivery

at home - injectables/ orals

IV based that require hospitation and in-person administration

body checkups

frequent blood tests enable impact assessment

initially during the medication trial - temperature mapping / BP/ allergic reactions =

keeping track of weights as medication impact

managing symptoms - adding weight - fat in specific for layer insulation in joints

a lot of new symtoms keep appearing every now and then

side effect <> symptoms

physical health

daily exercise as part of well-being

personal hygiene can be intensely demanding on the bad days - eg: "breakfast OR the shower"

mental health

frequent blood tests enable impact assessment

key factor in alleviation

correlation b/w being stressed = physical symptoms

noticeable pretty soon based on body symptoms

medidation workshops, yoga in coping

support groups - washington based - same experience, different location

its very hard to find focus groups - india specific - when done google search/ online search

its very hard to find focus groups - india specific - when done google search/ online search

wake up and have things to do - "not to think of pain and survival all the time"

creating support system to enable this - be it with clients/ but also friends. on not-so-good-days, limited operationalbility/ productivity

things could be as simple as brushing jhumroo/ basic tasks as well - personal

having a list of tasks helps motivate, structure and figure out the things to do

seeking therapy has helped

post anti- derpessants once a month check-ins

general frequency changes over the current state

6-8 months after developing did S then start consulting the therapy

depends on individuals on what and when is the individual "READY" to speak about these

next session of therapy instantenously scheduled after the first one as follow-up

diet

ensure eating food that does not impact the symptoms for both arthiritics and allergics

quinoa - great for arthiritis but allergic; very recent immune response

trial and error in terms of defining it - a lot more documentation and memorization

deteramental in thinking about pending work

i want this to be simplified where auto-scheduling; its easier to cancel if needed but if its already there, more change of compliance

feeling of helplessness, shame and lost of identity

frustration and imposter syndrome around - comapring self with peers

spoon theory for chronic illness

task taking specific amount of "spoon"; normal people have abundant/ regaain new easily; chronic illness have very limited --choosing where to put your spoon; spoon wind-up fighting the pain than the limited actogen itself

lack of empathy in understanding chronic fatigue, feelings, emotions

hard to explain the limited mental capacity

other indulganges

follow through other ig / content creato--

dark reels/ dark humor content to take it as is at the moment - feel better

harder to control your emotions to even consume
